

**AMENDMENTS TO THE SPECIFICATION:**

***Please replace the paragraph beginning at page 6, line 24, and ending on page 7, line 2, with the following amended paragraph:***

As seen in the picture the sterilisation chamber comprises fastening portions, formed in integration with the rest of the chamber. Said fastening portions 3e 3b are intended to be used for releasable mounting of the chamber in said sterilisation device by means of fasteners (not explicitly shown). In the present case the fastening portions are flat front and back surfaces 3e 3b, provided with openings, through which a screw of the like may be introduced and thereafter fastened in the housing. Other ways of mounting the chamber in the sterilisation device are possible and subject to construction preferences of the skilled man. Consequently, the chamber may easily be removed from the sterilisation device, and may thereby be replaced in case of wear or altered user needs.

***Please replace the paragraph beginning on page 7, line 3, and ending on page 7, line 10, with the following amended paragraph:***

In order to facilitate mounting, inlets for vapour, water and the like, and outlets for excess fluids, are integrally formed in said chamber. Thereby the mounting and the exchange of the chamber are further facilitated. In a preferred embodiment the chamber comprises at least one inlet 3d integrally formed therewith for connection to a sterilant source from the sterilisation device. The placement and configuration of inlets and outlets in said chamber are subject to preferences of the skilled man, and previously known, and will not be closer described herein.
